

PHASE 1: UNDERSTANDING AGILE MANIFESTO

Step 1: Agile Manifesto Values

Agile Value	Traditional Limitation	Agile Solution
Individuals & interactions over processes & tools	Communication is rigid and formal; developers wait for documents and approvals, causing delays.	Daily stand-ups and open team discussions enable quick collaboration and faster problem-solving.
Working software over comprehensive documentation	Months spent writing detailed requirement documents before coding, delaying delivery.	Agile delivers working features early, even with minimal documentation, so stakeholders see progress faster.
Customer collaboration over contract negotiation	Customers are only involved at the start and end, leading to mismatches.	Agile involves customers continuously through sprint reviews and feedback loops, ensuring evolving needs are met.
Responding to change over following a plan	Requirements are locked early; changes are costly and disruptive.	Agile welcomes change by reprioritizing the backlog and adjusting sprint goals, keeping the product relevant.

Step 2: Agile Principles

Agile Principle	Practical Implication (Daily Work)
Early and continuous delivery	Teams release small increments regularly, so testers and users validate features early.
Welcoming changing requirements	Developers must be flexible; backlog reprioritization is common, and tasks may shift mid-sprint.
Frequent delivery of working software	Work is organized into short sprints, requiring usable features every 2–4 weeks.
Collaboration between business and developers	Business stakeholders attend sprint reviews and planning meetings, ensuring alignment with market needs.
Working software as a measure of progress	Progress is tracked by completed user stories, not documents or plans, shifting focus to tangible outcomes.

Agile Principle	Practical Implication (Daily Work)
Continuous improvement through reflection	Teams hold retrospectives after each sprint, identify what went well/poorly, and create action items for improvement.

PHASE 2: MAPPING AGILE PRINCIPLES TO PRACTICES USING TAIGA

PHASE 3: CHANGE SIMULATION & REFLECTION

- Which Agile principle was easiest to implement using Taiga?
 - ⇒ Task tracking and progress monitoring was easiest because Taiga provides boards and sprint tracking to manage work easily.
- Which principle was difficult to represent using a tool?
 - ⇒ Face-to-face communication was difficult because real discussions and teamwork cannot be fully replaced by tools.

3. How does Taiga support collaboration and transparency?
 - ⇒ Taiga allows all team members to view tasks, progress, and updates, improving teamwork and transparency.
 4. Can Agile values exist without tools? Justify.
 - ⇒ Yes, Agile values can exist without tools because teamwork, communication, and adaptability matter more than software tools.
-

Reflection Write-Up =>

This exercise demonstrated how the values and principles of the Agile Manifesto can be applied using an Agile project management tool such as Taiga. By setting up a Scrum-based project for the Online Course Registration System (OCRS), the connection between Agile principles and their corresponding practices became clear. Among the principles explored, adapting to changing requirements was the easiest to implement, as Taiga allows simple backlog reprioritization and the addition of new user stories without affecting completed work. This clearly reflects Agile's flexibility.

However, representing the principle of individuals and interactions over processes and tools was slightly more challenging, since tools can support communication but cannot replace human collaboration. Taiga supports collaboration and transparency through features like comments, task discussions, sprint boards, and shared backlogs, which help keep team members aligned.

The exercise also showed that Agile values can exist without tools, but tools like Taiga make Agile practices more structured and manageable. Overall, this lab reinforced that Agile is a mindset focused on flexibility, feedback, and collaboration, supported—but not defined—by tools.
